

JANE API description

Version 0.1

Author: Martijn Schuemie

URL parameters

The JANE web application can be accessed with parameters in the URL.

Start page URL parameters

• structured Start page with structured query box. Example:

http://jane.biosemantics.org/index.php?structured

 text Prepopulate the text field. Example: http://jane.biosemantics.org/index.php?text=This is a test

Suggestions page URL parameters

findJournals
findAuthors
findPapers
structured
Returns suggestions for authors
Returns suggestions for papers
structured

• *text* Input text

Examples:

http://jane.biosemantics.org/suggestions.php?findPapers&structured&text=malaria AND vaccine

http://jane.biosemantics.org/suggestions.php?findJournals&text=Treatment of HIV in third world countries

Web service API

JANE can also be accessed as a SOAP web service. The WSDL can be found at:

http://jane.biosemantics.org:8080/JaneServer/services/JaneSOAPServer?wsdl

The most important methods are:

Journal[] getJournals(String text, String filterString)

o *text* the input text

o *filterString* a string specifying filters for the search. Best to leave empty

Author[] getAuthors(String text, String filterString)

o *text* the input text

o filterString a string specifying filters for the search. Best to leave empty

Paper[] getPapers(String text, String filterString, int count, int offset)

o *text* the input text

o filterString a string specifying filters for the search. Best to leave empty

count number of papers to returnoffset (typically 0 when starting)

Each of these methods returns an array of objects. See the WSDL for details on the structure of these objects.
